Starting texture generation

Open a window

Open a window **`Tools / VFXTextureMaker`**	An empty window will appear	
Creating a New Texture

Creating a New Texture **`File / New File`**	Specify the file name and path and save	
The window will be updated	Two files will be generated Texture: Output result TextureData: file that stores parameters	

Adding a Layer

This tool allows you to adjust the appearance of a texture by stacking multiple layers. Layers include those that draw shapes and noise,There are various types, including those that transform textures. First, let's add a Layer to draw the shape. Click the `+` button and select `Draw` → `Shape`	A circular glow appeared	
Adjusting Layer Parameters

Next, adjust the Layer parameters to change the shape. **Parameter adjustments are made on the right side of the window**	Click on the grey label to reveal the collapsed parameters Open `Shape` and change `ShapeType` to `Polygon`	
Change it to a type that generates polygonal shapes, and the number of corners is set to the default value of 3. A triangular shape appears	The shape is outside the texture frame, so try adjusting the size. Open `UV Deform` and change `X` and `Y` of `Tile` to `3`.	
Now the triangle fits inside the frame.	
Texture updates

Once you've finished adjusting the appearance,Renderpress the button to update the texture **The display in the window is a preview, so it will not be reflected in the texture until you press the `Render` button.**	First check the generated texture, and if it looks the same as the preview, the update is complete.	
Window Description

Layer List

Displays a list of layers	Operation example	
Adding a Layer Select the type from the dropdown menu that appears when you press the `+` button.	Layer Selection The selected layer will have a blue background.	Deleting a Layer Press the `-` button to delete the selected layer.	
Changing the Layer Order Change the order of layers by dragging and dropping	Hiding a Layer Hidden layers do not affect the generated texture.	Layer Edit Lock You will not be able to edit the parameters of a locked layer.	
Mask function ON/OFF When turned on, it will be masked by the specified layer.	Changing the mask layer Change the layer to use when mask is ON	
Layer Details

	
Operation example	Duplicating a Layer Right-click on the Layer name and select Duplicate Array Element It will be duplicated under the selected layer.	
Copying Layer Parameters Right-click on the Layer name and select Copy Selecting `Paste` on another layer will overwrite the parameters	
Preview

A preview of the generated texture is displayed	
Operation example	Select what to preview Result: Displays the texture to be output Select Layer: Displays the appearance of the selected layer.	
Preview channel selection Only the selected channel is displayed	
setting

`Settings`Press to display the setting items	Changing the resolution	
!

animation

Six Press to display the items **Animate the parameters and output in TextureSheet format.**	Operation example	

Animation function ON/OFF	Change the number of frames Texture size increases with the number of frames	Selecting a frame to edit	
Animating a parameter	Hit a keyframe Press the button to key the selected frame. Parameters can only be edited for frames where keys are entered. Unkeyed frames are processed using linear interpolation	
Changes to editing methods You can change from keyframe to curve method. In the curve method, the parameter input field changes to AnimationCurve.	
output

RecodePress to output the texture. **Overwrites the texture output when the file is created.**	
File Operations

Creating a New Texture **`File / New File`**	`File` → `Load`Load an existing TextureData with *The same process can be performed by dragging and dropping TextureData into the window.	
Creating a New Texture **`File / New File`**	`File` → `Copy`Duplicate the currently open TextureData and Texture with Enter the hierarchy and file name as you did when creating it. *The same process can be performed from the TextureData context menu.
